Business Requirements Document

Improving Same-Day Delivery for Myntra and Ajio

A fresher BA portfolio project exploring delivery gaps and return rate problems in Indian fashion e-commerce

BACKGROUND

During a personal data analysis study, I examined 7,000 Myntra fashion orders from April to June 2022, which is how I came across this issue. I discovered that standard delivery had a 5.08% return rate much higher than what I had anticipated while cleansing the data and creating pivot tables. Additionally, the average value of returned orders was greater (Rs. 675) than that of completed orders (Rs. 655), leading me to believe that customers were making impulsive purchases that they later regretted.

This made me wonder how same-day delivery in particular influences return behaviour. Same-day delivery is currently growing in Indian metropolitan areas thanks to platforms like Myntra (M-Now) and Ajio (Rush). However, fast commerce applications like Swiggy Instamart, Zepto, and Blinkit are also entering the fashion industry. I wanted to know if same-day fashion delivery is genuinely effective and what issues it raises.

In order to map out the competitive environment, I analysed 13 platforms in terms of delivery speed, city coverage, fees, minimum order value, and market share. This paper highlights my research and offers business analysis-based solutions.

PROBLEM STATEMENT

Myntra and Ajio provide same-day delivery in a few major locations, however based on the information I collected, I believe they are currently dealing with three primary issues:

- Only a few cities are served by their same-day delivery. Zepto and Blinkit each cover 25–30 cities, but Myntra M-Now only covers 4 metro areas.
- They have a significantly higher minimum order value. While Blinkit and Zepto start at Rs. 99, Myntra wants a minimum of Rs. 799 for same-day purchases. There is an eight-fold difference.
- Why Since standard 1-2-day shipping from Amazon and Flipkart is already quick throughout India, shoppers may not always perceive the benefit of spending more for same-day fashion delivery.
- According to my dataset, return rates for standard delivery orders are significant (5.08%), and same-day delivery might actually increase impulsive purchases.

OBJECTIVE

This document's objective is to determine what modifications Myntra and Ajio could make to:

• Lower return rates for orders with quick delivery

• Increase accessibility to same-day delivery (more cities, fewer hurdles)

• In the fashion area, outperform Blinkit and Zepto.

From the viewpoint of a business analyst assisting a product or operations team with this issue, I have created requirements, user stories, and KPI

STAKEHOLDERS

These are the key people who would be involved if this project was taken forward in a real company:

Stakeholder	Why They Are Involved	Interest Level	How to Engage Them
Product Manager	Owns the size recommender and nudge features	High	Weekly sprint check-ins
Operations Team	Handles return logistics and fulfillment costs	High	Monthly KPI reviews
Seller / Merchant Partners	Responsible for product quality and packaging	Medium	Seller scorecard + training
Customer Experience Team	Deals with return complaints and customer satisfaction	High	Bi-weekly feedback review
Finance Team	Tracks cost of returns and margin impact	High	Quarterly reporting
Data / Analytics Team	Builds dashboards and return rate models	Medium	Ongoing data pipeline work

USER STORIES

I have written these in the standard Agile format used in BA and product roles:

ID	As a...	I want to...	So that...	Priority
US-01	Customer	See a size suggestion before I buy	I pick the right size and do not have to return it	High
US-02	Customer	See clear photos showing fabric texture and fit	I know what I am buying before it arrives	High

US-03	Operations Manager	See return rate broken down by delivery type in a dashboard	I can spot which delivery method causes more returns	High
US-04	Seller	See a monthly report showing my return rate by category	I can improve my listings and packaging on my own	Medium
US-05	Product Manager	Test a short delay nudge on high-value same-day orders	I can check if it reduces impulse returns before launching it fully	Medium
US-06	Finance Team	Track return costs by product category monthly	I can focus our return reduction effort where it costs us most	Medium

REQUIREMENTS

Functional Requirements - What the system should do

ID	Requirement	Links to	Priority
FR-01	The platform should show a size recommendation on the product page based on the customer's past orders and the brand's size chart	US-01	Must Have
FR-02	For same-day orders above Rs. 600, the platform should show a short confirmation prompt asking the customer if they want to proceed giving them a moment to reconsider	US-05	Must Have
FR-03	The system should track how many times each customer returns items per quarter and group them into Low, Medium, or High return behaviour	US-03	Must Have
FR-04	An operations dashboard should show return rate split by fast delivery vs standard delivery, and by fashion category	US-03	Must Have
FR-05	The seller portal should show each merchant their monthly return rate by category along with simple tips to improve it	US-04	Should Have

FR-06	Customers who return more than 3 times in a quarter should be required to pay a small fee for return pickup from the 4th return onwards	US-03	Should Have

Non-Functional Requirements - How the system should behave

ID	Type	Requirement	Acceptance Criteria
NFR-01	Speed	The size recommender should load within 1 second on both mobile and desktop	95% of loads under 1 second
NFR-02	Data	Customer return tier should be updated every week based on the last 90 days of order history	Tier refreshed every 7 days
NFR-03	Legal	Any changes to the return policy must be reviewed and approved by the legal team before going live	Legal sign-off before launch
NFR-04	Usability	The operations dashboard should work properly on mobile screens so the team can check it from anywhere	Tested on Android and iOS

SUCCESS METRICS

These are the numbers I would track to know if the solutions are actually working:

What We Are Measuring	Current Situation	Target in 6 Months	How to Measure
Overall return rate	5.08% on standard delivery	Below 3%	Monthly returns report
Western Dress return rate	2.4%	Below 1.5%	Category dashboard
Size recommender usage	0% (feature not built yet)	60% of checkout sessions	Product analytics
Same-day city coverage - Myntra M-Now	4 metros	15+ cities	Operations report

Reverse logistics cost per returned order	Baseline to be set in Month 1	Reduce by 20%	Finance monthly report
Seller scorecard usage rate	0% (feature not built yet)	80% of active sellers	Seller portal analytics

RISKS

A few things could go wrong with these solutions, and I have noted how I would suggest handling them:

Risk	How Likely	What I Would Suggest
The confirmation nudge makes customers drop off before buying	Medium	Test it on a small portion of users first and track conversion rate before rolling out fully
Sellers do not use the return scorecard or take it seriously	High	Give top-performing sellers better search placement as an incentive to improve
Size recommender gives wrong suggestions early on	Medium	Train the model on at least 6 months of data before showing it to customers
Customers complain about the new return fee policy	Medium	Only apply the policy to new orders after the launch date , do not change rules for existing orders

PROPOSED SOLUTION SUMMARY

Based on my research, I am suggesting five practical improvements

- **Sizing Recommender**: Based on the brand's sizing guide and previous orders, this tool helps clients choose the right size. In particular, Western dresses and sets, which had the highest return rates in my dataset, should see a decrease in returns due to size mismatch.
- **Confirmation Nudge**: When a customer chooses same-day delivery for an order over Rs. 600, a quick alert asking for confirmation is displayed. This may lessen impulse returns by adding a tiny moment of friction. In my data, returned orders averaged Rs. 675, which is more than completed orders. This shows that impulsive purchases are taking place.
- **Seller Return Scorecard**: Provide a straightforward monthly report with practical advice that breaks down each seller's return rate by category. Better prominence on the site ought to be given to sellers who do well.

- **Return Tier Policy:** Monitor each customer's return behaviour. After their fourth return in a quarter, customers who return things regularly may be eligible for a small return charge. This is similar to what international retailers like Zara Europe and Amazon US already do.
- **Increase Same-Day Coverage**: Blinkit currently covers more than 30 cities, but Myntra M-Now only covers 4 metro areas. The feature would become more competitive and meaningful if it were expanded to at least 15 cities in a year.

PROPOSED SOLUTION SUMMARY

If I were supporting a team working on this, I would suggest rolling it out in phases rather than launching everything at once:

Phase	When	What Gets Done	Who Leads It
Phase 1	Month 1	Build the return rate dashboard so the team can see the baseline numbers clearly	Data / BA Team
Phase 2	Month 2-3	Launch seller scorecards and enforce better photo standards for high-return categories	Operations + Seller Team
Phase 3	Month 3-5	Build size recommender and test the confirmation nudge on a small group of users	Product Team
Phase 4	Month 4	Launch return tier policy with legal sign-off - apply only to new orders going forward	CX + Legal + Finance
Phase 5	Month 6	Review all KPIs - check if return rate has come down and whether same-day adoption has improved	All Stakeholders

DATA SOURCE AND ASSUMPTIONS

Data I Used

- From April to June 2022, 7,000 Myntra fashion orders were examined in-person using Excel, MySQL, and Power BI

- 13 platforms' competitive data was manually gathered from news articles, public sources, and platform websites.
- Estimates of market share are derived on industry reports by Redseer and Bernstein (2024–2025).
- Public announcements' coverage of Ajio Rush City (January 2025)

Assumptions I Made

- Although precise numbers will vary, the 7,000-row dataset is a good stand-in for platform-level return trends.
- The market share estimates for Myntra M-Now and Ajio Rush (3% each) are approximations; precise data are not made public.
- Based on industry comparisons, the cost of reverse logistics per order is thought to be substantial; however, the Myntra/Ajio expenses are not made public.
- Phased rollout takes into account the product and technical team's appropriate bandwidth, which is assumed by all suggested solutions.

LEARNINGS FROM THIS PROJECT

This is my first BRD, and I found the method to be rather helpful in comprehending how a BA approaches a topic. Here are some things I learned:

- It is easier for various teams to take action when a business problem is divided into requirements, user stories, and KPIs.
- Data may not always provide the whole picture. My Excel study revealed a 5.08% return rate, but in order to comprehend why it occurs, I had to consider the larger picture of same-day delivery behaviour.
- Stakeholder mapping made it clear to me that a product issue like returns affects not only the product team but also operations, finance, sellers, and customers.
- In a later version of this project, I would like to expand on this by properly wireframing the seller scorecard and size recommender functionality using Figma or Balsamiq.
